

**AMENDMENTS****Amendments to the Claims:**

Please replace the claims with the following listing of claims.

1. (Currently Amended) A method for ensuring client access to unpaired messages from a server, comprising:

the server detecting and storing at least one unpaired message to be stored in a data structure in an unpaired message queue, the at least one unpaired message comprising a communication response for a specific client, the server distinguishing the at least one unpaired message from a paired message in response to a communication disruption between the client and the server;

creating the unpaired message queue data structure in a server, the unpaired message queue data structure configured to store a plurality of unpaired messages intended for a the client; and  
utilizing a protocol which allows the client to request at least one unpaired message stored in the unpaired message queue data structure.

2. (Currently Amended) The method of claim 1 further comprising the server dynamically creating the unpaired message queue data structure in response to the server detecting at least one unpaired message.
3. (Currently Amended) The method of claim 1, further comprising notifying the server of a client request to enable dynamic creation of the unpaired message queue data structure.
4. (Original) The method of claim 3, wherein notifying the server occurs during establishment of communications between the client and the server.

5. (Currently Amended) The method of claim 1, further comprising the server notifying the client when the unpaired message queue data structure contains an unpaired message.
6. (Original) The method of claim 1, further comprising:  
generating a request message to be sent from the client to the server; and  
storing an indicator in the request message to enable the client to distinguish between unpaired messages.
7. (Currently Amended) The method of claim 1, wherein utilizing the protocol further comprises allowing the client to request automatic transmission of unpaired messages stored in the unpaired message queue data structure.
8. (Currently Amended) A computer readable medium having stored thereon computer executable instructions for performing a method for ensuring client access to unpaired messages from a server, the method comprising:  
the server detecting at least one unpaired message to be stored in a an unpaired message queue data structure, the server distinguishing the at least one unpaired message from a paired message in response to a communication disruption between the client and the server;  
creating the unpaired message queue data structure in a server, the unpaired message queue data structure configured to store a plurality of unpaired messages intended for a client;  
utilizing a protocol which allows the client to request at least one unpaired message stored in the unpaired message queue data structure.

9. (Currently Amended) The computer readable medium of claim 8, wherein the method further comprising the server dynamically creating the unpaired message queue data structure in response to the server detecting at least one unpaired message.
10. (Currently Amended) The computer readable medium of claim 8, wherein the method further comprises ing notifying the server of a client request to enable dynamic creation of the unpaired message queue data structure.
11. (Original) The computer readable medium of claim 10, wherein notifying the server occurs during establishment of communications between the client and the sever.
12. (Currently Amended) The computer readable medium claim 8, wherein the method further comprises ing the server notifying the client when the unpaired message queue data structure contains an unpaired message.
13. (Currently Amended) The computer readable medium of claim 8, wherein the method further comprises ing:  
generating a message to be sent from the client to the server;  
storing an indicator in request message to enable the client to distinguish between unpaired messages.
14. (Currently Amended) The computer readable medium of claim 8, wherein utilizing the protocol further comprises allowing the client to request automatic transmission of unpaired messages stored in the unpaired message queue data structure.

15. (Currently Amended) A system for ensuring client access to unpaired messages from a server comprising:

a request module configured to receive a client request;

a response generator which receives the client request form the request module and generated an appropriate response;

an unpaired message module which analyzes the response message generated by the response generator and configured to distinguish a paired message from an unpaired message in response to a communication disruption between the client and the server and to store paired messages in a paired response data structure and unpaired messages in an unpaired response data structure; and

a response module which communicates paired and unpaired messages to a client.

16. (Original) The system of claim 15, wherein the unpaired message module is further configured to dynamically create the unpaired response data structure in response to a first unpaired response message.

17. (Original) The system of claim 15, wherein the response module is configured to automatically send all unpaired messages stored in the unpaired response data structure.

18. (Original) The system of claim 15, wherein the response module is configured to send all unpaired messages stored in the unpaired response data structure in response to a request from the client.

19. (Original) The system of claim 15, wherein the system is activated upon the server receiving an activation request from the client.

20. (Original) The system of claim 15, wherein the response module notifies the client when the unpaired response data structure contains at least one unpaired message.
